ANNEX 2: DETECTION SYSTEMS NOT APPLICABLE TO THE STUDY .....	38

**1.-INTRODUCTION**

This document specifies the requirements for non TSI compliant train detection systems in a harmonised format. The following table presents a summary of the parameters in which each train detection system

Table 01

TECHNOLOGY	System	SDT	Axle distances					Wheel geometry						Other parameters					EMC		
			<a href="#">3.1.2.1</a>	<a href="#">3.1.2.2</a>	<a href="#">3.1.2.3</a>	<a href="#">3.1.2.4</a>	<a href="#">3.1.2.5</a>	<a href="#">3.1.3.1</a>	<a href="#">3.1.3.2</a>	<a href="#">3.1.3.3</a>	<a href="#">3.1.3.4</a>	<a href="#">3.1.3.5</a>	<a href="#">3.1.3.6</a>	<a href="#">3.1.4</a>	<a href="#">3.1.5</a>	<a href="#">3.1.6</a>	<a href="#">3.1.7</a>	<a href="#">3.1.8</a>	<a href="#">3.1.9</a>	<a href="#">3.2.1</a>	<a href="#">3.2.2</a>

✓	V5 compliant
✗	Not or partially compliant with V5
	Not relevant to this system

This report applies to train detection systems that do not comply with the TSI, which are installed in the Member State **Spain (ES)**.

The requirements of this document ensure compatibility with the following non-TSI-compliant train detection systems:

*Table 02*

Track circuits	Axle counters
<ul style="list-style-type: none"> <li>• FS 2000/5000</li> <li>• FS 3000</li> <li>• DSA 50 Hz</li> <li>• CV 50Hz ALCATEL</li> <li>• TI21 I-M</li> <li>• EBITRACK 400</li> <li>• 50 Hz (ERICSSON-ADTRANZ)</li> <li>• GRS</li> <li>• 50 Hz ENYSE</li> <li>• UM71-2000</li> </ul>	<ul style="list-style-type: none"> <li>• SIG L90</li> <li>• RSL</li> <li>• RSR 122</li> <li>• DEF-87-CE (E-CE-95)</li> </ul>

This inform does not cover metric gauge lines (1000 mm) and those intended for the classification and management of goods within port facilities.

Note: The parameters faced by Train Detection Systems are described in ERA/ERTMS/033281 v.5.

### 3.1.-VEHICLE DESIGN AND OPERATION

#### 3.1.1.-Definitions

For the definition of the longitudinal dimensions of the vehicle Figure, (which shows an example for a three-axle twin-bogie vehicle), applies, where:

$a_i$  = distance between following axles, where  $i = 1, 2, 3, \dots, n-1$ , where  $n$  is the total number of axles of the vehicle

$b_x$  = distance from the first axle ( $b_1$ ) or the last axle ( $b_2$ ) to the nearest end of the vehicle, i.e. nearest buffer/nose

$L$  = total length of the vehicle

*Figure 1: Longitudinal vehicle dimensions*

If more vehicles are connected in a consist, the characteristics stated in the remainder of this section 3.1 and related to  $a_i$  apply to the relevant distance of the axles belonging to each vehicle individually, while the characteristics related to  $b_i$  only apply to the two ends of the complete consist.

For definition of wheel dimensions Figure 2 applies, where:

$D$  = wheel diameter

$B_R$  = width of the rim

$S_d$  = thickness of the flange measured at the line 10mm above the running tread as given in Figure 2

$S_h$  = height of the flange

Other dimensions in Figure 2 are not relevant in this document.

Figure 2: Wheel and wheelset dimensions

The values quoted in the following paragraphs are absolute limit values including any measurement tolerances.

The term wheelset applies to any pair of opposite wheels, even those not connected by a common axle. Except where stated, wheelset assemblies are assumed to have continuous wheel centres and not have spoke wheels. Any references to wheel sets concern centre of wheels.

### 3.1.2.-Axle distances

#### 3.1.2.1.-MAXIMUM AXLE DISTANCE

Compliant with ERA/ERTMS/033281 version 5.0 (1668mm and 1435 mm track gauge).

#### 3.1.2.2.-MINIMUM AXLE DISTANCE

Compliance with ERA/ERTMS/033281 version 5.0 (for 1668mm and 1435mm track gauges) is achieved except for **SIG L90 and RSL axle counters**, both equipped with **Zp30C wheel sensors**, where the minimum wheelbase is adjusted according to the following table:

Table 04

Speed	Wheel Diameter	Axle distance
$v \leq 300$ km/h	$D \geq 900$ mm	$\geq 1.5$ m

In the case of the **DEF-87-CE** sensors (also used in **E-CE-95** track circuits), partial compliance with the ERA/ERTMS/033281 limits is observed, specifically those defined for speeds of up to 300 km/h. For speeds above 300 km/h, the minimum wheelbase will be the product of the speed and 7.2, which is greater than the value set in version 5 (2160 mm).

#### 3.1.2.3.-MINIMUM DISTANCE BETWEEN THE FIRST AND LAST AXLES

Compliance with ERA/ERTMS/033281 version 5.0 (for 1668mm and 1435mm track gauge), **except for** the following exceptions:

Table 05

<b>FS2000/5000 and FS3000</b>	The maximum distance for the neutral zone is 4000 mm.
<b>UM71-2000</b>	The maximum distance for the neutral zone can reach up to 10000 mm.

Note 1: In the reference standard, the parameters are specified by focusing on rolling stock, which means that the parameter corresponding to the track circuit is the inverse. Specifically, when referring to the "minimum distance between the first and last axles", this minimum value must coincide with the maximum configuration value of the track circuit, which in this case refers to the maximum length of the antenna or neutral zone.

Note 2: The worst-case scenario that technology allows is considered, even though the parameter for the neutral zone between two track circuits directly depends on the design and configuration of the facilities.

**3.1.2.4.-DISTANCES BETWEEN THE END OF THE TRAIN AND THE FIRST AXLE OF THE NEW HIGH-SPEED LINES**

Compliance with ERA/ERTMS/033281 version 5.0 (1668mm and 1435 mm track gauge).

Note: This parameter is not considered a feature of the train sensing system itself, but rather a variable of the design phase of the line.

**3.1.2.5.-DISTANCES BETWEEN THE END OF THE TRAIN AND THE FIRST AXLE ON OTHER LINES**

Compliance with ERA/ERTMS/033281 version 5.0 (1668mm and 1435 mm track gauge).

Note: This parameter is not considered a feature of the train sensing system itself, but rather a variable of the design phase of the line.

**3.1.3.-Wheel geometry**

**3.1.3.1.-MINIMUM RIM WIDTH**

Compliance with ERA/ERTMS/033281 version 5.0 (1668mm and 1435 mm track gauge).

**3.1.3.2.-MINIMUM WHEEL DIAMETER**

Compliance with the ERA/ERTMS/033281 version 5.0 (1668mm and 1435 mm track gauge), except for **DEF-87-CE** (also used in **E-CE-95** track circuits) for which compliance is partial, as its value is valid for speeds up to 350 km/h (criteria evaluated by its certification in ERA/ERTMS 033281 V.3), but not calculated for higher speeds, as it is an open point in the repealed regulation. However, since the maximum speed of Spanish railway lines is less than 350 km/h, these systems will be considered compliant with interoperability regulations.

**3.1.3.3.-MINIMUM FLANGE THICKNESS**

Compliance with ERA/ERTMS/033281 version 5.0 (1668mm and 1435 mm track gauge), except for **SIG L90** and **RSL** axle counters, both with **Zp30C** wheel sensors, where the wheel flange thickness range adjusts to the following table:

*Table 06*

Track gauge [mm]	Wheel diameter D [mm]	Flange thickness $S_d$ [mm]
1435	$330 \leq D \leq 840$	From 27.5 to 33
1668	$D \geq 840$	From 22 to 33

**3.1.3.4.-FLANGE HEIGHT**

Compliance with ERA/ERTMS/033281 version 5.0 (1668mm and 1435 mm track gauge), with the exception of the **SIG L90** and **RSL** axle counters, both with **Zp30C** wheel sensors, where the wheel flange height range adjusts to the following table:

*Table 07*

Track gauge [mm]	Wheel diameter D [mm]	Flange height S <sub>h</sub> [mm]
1435	330 ≤ D ≤ 760	From 32 to 38
1668	D ≥ 760	26 to 36 (compliance with ERA/ERTMS/033281 v.5.0)

For **RSR122** it partially complies with the minimum wheel flange thickness requirement in accordance with version 5 of the aforementioned standard.

*Table 08*

Track gauge [mm]	Wheel diameter D [mm]	Flange height S <sub>h</sub> [mm]
1435	330 ≤ D ≤ 760	From 32 to 38
1668	D ≥ 760	26 to 38 (compliance with ERA/ERTMS/033281 v.5.0)

**3.1.3.5.-METAL AND INDUCTIVE COMPONENTS BETWEEN WHEELS**

Compliance with ERA/ERTMS/033281 version 5.0 (1668mm and 1435 mm track gauge).

**3.1.3.6.-WHEEL MATERIAL**

Compliance with ERA/ERTMS/033281 version 5.0 (1668mm and 1435 mm track gauge).

**3.1.4.-Using Sandblasting Equipment**

Compliance with ERA/ERTMS/033281 version 5.0 (1668mm and 1435 mm track gauge).

### **3.1.5.-On board flange lubrication**

Compliance with ERA/ERTMS/033281 version 5.0 (1668mm and 1435 mm track gauge).

### **3.1.6.-Use of composite brake shoes**

Compliance with ERA/ERTMS/033281 version 5.0 (1668mm and 1435 mm track gauge).

### **3.1.7.-Vehicle axle load and metal construction**

#### **3.1.7.1.-VEHICLE AXLE LOAD**

Compliance with ERA/ERTMS/033281 version 5.0 (1668mm and 1435 mm track gauge).

#### **3.1.7.2.-VEHICLE METAL CONSTRUCTION**

Compliance with ERA/ERTMS/033281 version 5.0 (1668mm and 1435 mm track gauge).

### **3.1.8.-Use of shunt assisting devices**

Compliance with ERA/ERTMS/033281 version 5.0 (1668mm and 1435 mm track gauge).

NOTE: The use of shunting assisting device is not required on the Spanish Rail Network if the vehicles are compliant with the requirements defined in this document.

### **3.1.9.-Impedance between wheels**

Compliance with ERA/ERTMS/033281 version 5.0 (1668mm and 1435 mm track gauge).

### 3.2.-ELECTROMAGNETIC COMPATIBILITY

#### 3.2.1.-ELECTROMAGNETIC FIELDS

##### 3.2.1.1.-FREQUENCY MANAGEMENT

Compliance with ERA/ERTMS/033281 version 5.0 (1668mm and 1435 mm track gauge), **except for RSR 122** axle counter detectors.

##### 3.2.1.2.-VEHICLE EMISSION LIMITS AND EVALUATION PARAMETERS

Compliance with ERA/ERTMS/033281 version 5.0, **except for the DEF-87-CE (E-CE-95)** axle counter detectors, as we can only ensure compliance with the limit values of ERA/ERTMS/033281 version 3.0, failing to meet the uncertainty range of version 5.0. And the **RSR122** sensors, where the narrowband emission limits and evaluation parameters are defined in Table 09.

Table 09

Type	Frequency range defined by the centre frequency [kHz]	Emission limit X Axis [dBµA/m] (RMS)	Emission limit Y Axis [dBµA/m] (RMS)	Emission limit Z Axis [dBµA/m] (RMS)	Evaluation method	Filter order (Butterworth) and 3 dB-bandwidth	Evaluation parameters
Band 3 (RSR122 SYS1)	1115 to 1145	99.7	78.6	61.7	BP	4th order 6.0 kHz	20% overlap (3 dB dots) Integration Time: 2 ms
Band 3 (RSR122 SYS1)	From 1020 to 1050	99.8	78.3	61.8	BP	4th order 6.0 kHz	20% overlap (3 dB dots) Integration Time: 2 ms

##### 3.2.1.3.-ASSESSING LIMIT EXCEEDANCES

Compliance with ERA/ERTMS/033281 version 5.0, **except for RSR122** axle counter detectors where the narrow band emission limits and evaluation parameters are defined in Table 10

Table 10

Frequency range	Field direction	Increasing of magnetic field limits for a reduced integration time of 0,5 x T <sub>int</sub>	
		[dB]	[dB]
27 to 52 kHz	X	2	6
27 to 52 kHz	Y, Z	6	12
234 to 287 kHz	X, Y, Z	6	12
287 to 363 kHz	X, Y, Z	3	6
740 to 1026 kHz	X, Y, Z	6	12
1020 to 1050 kHz	X, Y, Z	6	12
1115 to 1145 kHz	X, Y, Z	6	12

#### 3.2.1.4.-MEASUREMENT, TEST AND EVALUATION SPECIFICATION

The tests for the acquisition of the indicated values have been designed and executed by the company supporting the system following the specifications and parameters set forth in the standard EN 50592:2016.

#### 3.2.2.-CONDUCTED INTERFERENCE

##### 3.2.2.1.-VEHICLE IMPEDANCE

Regarding vehicle impedance, in the Spanish legal framework, order TMA 576/2020 generally mandates that "each influencing unit (self-propelled unit, locomotive in simple composition, or car with a pantograph) must have a minimum input impedance of 2  $\Omega$  at 50 Hz."

NOTE: The same order, more specifically in section 4.2.3.3.1.1, specifies that to ensure compatibility with train detection systems based on track circuits, "all electric traction rolling stock operating on direct current lines equipped with 50 Hz track circuits must be equipped with a 50 Hz detector that will act on the traction system and the auxiliary services converter when it detects, for more than 2 seconds, an intensity level greater than 1.5A RMS. The filter equipped by the detector will have a maximum bandwidth of  $\pm 2$  Hz."

##### 3.2.2.2.-TRACTION CURRENT

Compliance with ERA/ERTMS/033281 version 5.0 track circuits, **except for FS2000/5000, FS3000, GRS, TI 21 I-M, EBITRACK 400, UM71-2000 track circuits** and, in general, all track circuits based on 50 Hz electrical circuits (DSA 50 Hz, ERICSSON and ENYSE) will be considered exceptions.

**3.2.2.2.1.-25 kV AC, 50 Hz Electromagnetic Interference Limits**

**FS 3000**

The track circuit does not comply with the limits established by ERA/ERTMS 033281. The interference current limits considered for the current train detection system shall be those specified in EN 50238-2:2020, Annex A.

*Table 11*

Frequency range	Interference current limit [rms value]	Evaluation method	Evaluation parameters
4080 Hz	0.52 A	Band-Pass Filter	<ul style="list-style-type: none"> <li>• BP filter characteristics: Centre frequency range: 4080 Hz 3dB bandwidth: 124 Hz Butterworth, order 2· N= *</li> <li>• RMS Calculation: Integration Time: **s. 7200 Hz	0.24 A	Band-Pass Filter	<ul style="list-style-type: none"> <li>• BP filter characteristics: Centre frequency range: 7200 Hz 3dB bandwidth: 124 Hz Butterworth, order 2· N= *</li> <li>• RMS Calculation: Integration Time: **s. Time overlap: min 50%</li> <li>• Evaluation criteria: Maximum time to exceedance: 0.016 seconds. Minimum time between two exceedances: 0.514 s.</li> </ul>

\*The nearest standard order in the evaluation method will be chosen to match the 3 dB deployment points.

\*\* Where the integration time to calculate the RMS value is not indicated, the duration of one cycle at the frequency of the considered circuit will be used.

TI21 I-M

The track circuit does not comply with the limits established by ERA/ERTMS 033281. The interference current limits considered for the current train detection system shall be those specified in EN 50238-2:2020, Annex A.

Table 13

EN 50238-2:2020			
Frequency range	Interference Current Limit [rms value]	Evaluation method	Evaluation parameters
1533-1566 Hz	0.806 A	Band-Pass Filter	<ul style="list-style-type: none"> <li>BP filter characteristics: Centre frequency: 1549 Hz 3dB bandwidth: 12 Hz Butterworth, order 2· N= *</li> <li>RMS Calculation: Integration Time: 0.04 sec Time overlap: min 50%</li> <li>Evaluation criteria: Maximum Time to Overcome: 0.04 sec</li> </ul>

#### 50 HZ ERICSSON-ADTRANZ

The track circuit does not comply with the limits established by ERA/ERTMS 033281. The interference current limits considered for this train detection system will be those specified in the national standard Order TMA 576:2020.

Table 27

Frequency Range	Interference Current Limit [rms value]	Evaluation method	Evaluation parameters
50 Hz	1.5 A	Band-Pass Filter	<ul style="list-style-type: none"> <li>• BP filter characteristics: Centre frequency range: 50 Hz 3dB bandwidth: 2 Hz Butterworth, order 2· N= *</li> <li>• RMS Calculation: Integration time: 0.02 sec. Time overlap: min 50%</li> <li>• Evaluation criteria: Maximum time to exceedance: 0.2 seconds.</li> </ul>

\*The nearest standard order in the evaluation method will be chosen to match the 3 dB deployment points.

#### GRS

GRS is an ATP-coded track circuit. This track circuit does not comply with the limits set by ERA/ERTMS 033281. The interference current limits considered for the current train detection system shall be those specified in EN 50238-2:2020, Annex A.

Table 28

Frequency Range	Interference Current Limit [rms value]	Evaluation method	Evaluation parameters
75 Hz	0.5 A	Band-Pass Filter	<ul style="list-style-type: none"> <li>BP filter characteristics: Centre frequency range: 57 Hz 3dB bandwidth: 20 Hz Butterworth, order <math>2 * N = 6</math></li> <li>RMS Calculation: Integration time: 0.2 sec. Time overlap: min 50%</li> <li>Evaluation criteria: Maximum time to exceedance: 0.2 seconds. Minimum time between two exceedances: 1.7 s.</li> </ul>
225 Hz	1 A	Band-Pass Filter	<ul style="list-style-type: none"> <li>BP filter characteristics: Centre frequency range: 225 Hz 3dB bandwidth: 20 Hz Butterworth, order <math>2 * N = 6</math></li> <li>RMS Calculation: Integration time: 0.2 sec. Time overlap: min 50%</li> <li>Evaluation criteria: Maximum time to exceedance: 0.2 seconds. Minimum time between two exceedances: 1.7 s.</li> </ul>
375 Hz	1 A	Band-Pass Filter	<ul style="list-style-type: none"> <li>BP filter characteristics: Centre frequency range: 375 Hz 3dB bandwidth: 20 Hz Butterworth, order <math>2 * N = 6</math></li> <li>RMS Calculation: Integration time: 0.2 sec. Time overlap: min 50%</li> <li>Evaluation criteria: Maximum time to exceedance: 0.2 seconds. Minimum time between two exceedances: 1.7 s.</li> </ul>
525 Hz	1 A	Band-Pass Filter	<ul style="list-style-type: none"> <li>BP filter characteristics: Centre frequency range: 525 Hz 3dB bandwidth: 20 Hz Butterworth, order <math>2 * N = 6</math></li> <li>RMS Calculation: Integration time: 0.2 sec. Time overlap: min 50%</li> <li>Evaluation criteria: Maximum time to exceedance: 0.2 seconds. Minimum time between two exceedances: 1.7 s.</li> </ul>

Frequency Range	Interference Current Limit [rms value]	Evaluation method	Evaluation parameters
675 Hz	1 A	Band-Pass Filter	<ul style="list-style-type: none"> <li>BP filter characteristics: Centre frequency range: 675 Hz 3dB bandwidth: 20 Hz Butterworth, order 2 * N = 6</li> <li>RMS Calculation: Integration time: 0.2 sec. Time overlap: min 50%</li> <li>Evaluation criteria: Maximum time to exceedance: 0.2 seconds. Minimum time between two exceedances: 1.7 s.</li> </ul>

### 50 HZ ENYSE

The track circuit does not comply with the limits established by ERA/ERTMS 033281. The interference current limits considered for this train detection system will be those specified in the national standard Order TMA 576:2020.

Table 29

Frequency Range	Interference Current Limit [rms value]	Evaluation method	Evaluation parameters
50 Hz	1.5 A	Band-Pass Filter	<ul style="list-style-type: none"> <li>BP filter characteristics: Centre frequency range: 50 Hz 3dB bandwidth: 2 Hz Butterworth, order 2· N= *</li> <li>RMS Calculation: Integration time: 0.02 sec. Time overlap: min 50%</li> <li>Evaluation criteria: Maximum time to exceedance: 0.2 seconds.</li> </ul>

\*The nearest standard order in the evaluation method will be chosen to match the 3 dB deployment points.

### **3.2.2.3.-MEASUREMENT, TEST, AND EVALUATION SPECIFICATION**

The measurements have been provided by the respective suppliers of train detection systems, taking into account the specifications of the prEN50728:2022 standard and the data provided by currently in force standards such as EN 50238-2:2020, Annex A, and the national standard Order 576/2022. Any significant discrepancy in the measurement parameters has been considered a reason for non-compliance, as it makes it impossible to correctly assess compatibility with the limits imposed by the ERA/ERTMS standard 033281 v.5.

The same applies to train detection systems that lack information on limits, such as those based on 50 Hz track circuits, for which a special warning is made about non-compliance due to the absence of interference current limit values. In these cases, we will consider that they do not admit any induced current to ensure their correct operation.

**ANNEX 1: NUMBER OF NON-COMPLIANT TRAIN DETECTION SYSTEMS PRESENT IN THE SPANISH RAILWAY NETWORK**

SUPPLIER	SDT	PRODUCT NAME	SECTIONS			
			0	1.5 Kv DC	3 Kv DC	25 KV 50 Hz
SIEMENS	TC	FS 2000/5000	169	0	1682	2
	TC	FS3000	149	0	2291	1207
	TC	DSA 50 Hz (DIMETRONIC)	21	0	1297	0
THALES	TC	50 Hz (ALCATEL-MARCONI)	18	0	614	0
	AC	SIG. L90	813			
	AC	RSL	242			
HITACHI	TC	UM71-2000	11	0	0	1505
FRAUSCHER	AC	RSR122	201			
ALSTOM	TC	TI21 I-M	20	0	1657	124
	TC	EBITRACK 400	0	0	160	133
	TC	50 Hz (ERICSSON-ADTRANZ)	43	0	1257	0
	TC	GRS	34	0	391	57
ELECTRANS	AC	DEF-87-CE (E-CE-95)	1244			
ENYSE	TC	50 Hz	35	0	535	0

**TOTAL: 15,912 Train Detection Systems**

**ANNEX 2: DETECTION SYSTEMS NOT APPLICABLE TO THE STUDY**

**JUSTIFICATION**

The train detection systems used in the Spanish railway network are characterised by their variety, versatility and functionality. Therefore, the diversity of products active today covers a wide range of technologies, applications, and suppliers. Within this variety, the presence of detection systems with a discrete and localized presence is noteworthy, in most cases far from the main international railway connection lines and which, in some way, have served as precursors to the systems currently deployed.

Carrying out a compatibility study of these systems, considered "singular", could be considered an unnecessary deployment of resources, since their consistency will not be certified in the future due to the null replicability declared by the supplier companies.

For this reason, these systems are listed and located in this Annex, with the aim of considering them from an anecdotal point of view and highlighting their unjustified incompatibility given the remote possibilities of interoperability of the secondary lines where they are present.
